# Products and system design for making PV a natural component of the building envelope

<u>P.-J. Alet</u>, J. Escarré, G. Cattaneo, H.-Y. Li, P. Heinstein, L. Sansonnens, S. Nicolay, J. Bailat, V. Musolino, C. Ballif, L.-E. Perret

Hamburg, 15.09.2015

World first white PV modules, by CSEM

#### PV in built areas

### **Buildings: the untapped potential**

#### PV in built areas

### **Integration challenges**

![](_page_2_Picture_3.jpeg)

#### Visual integration

### Trade-offs

![](_page_3_Figure_2.jpeg)

![](_page_3_Picture_3.jpeg)

#### **Visual integration**

### **IR filter technology**

Enabler: high IR response of modern cells • Benefits: 

![](_page_4_Figure_3.jpeg)

High stability of colour under changing viewing angle

![](_page_4_Figure_6.jpeg)

### PV modules as construction element

Demonstration house in BRE (UK) inaugurated 11<sup>th</sup> Sept. 2015

- CSEM: PV technology
- ÜserHuus: product development
- NexPower: PV module manufacturer
- Spanwall: façade element supplier
- Solmatix: installer

![](_page_5_Picture_11.jpeg)

### **Electrical integration challenges**

- PV system design, wiring
  - Complex shapes and shading patterns
  - Lack of suitable standards for DC wiring in buildings
- Alignment between local consumption and production
  - For the user: energy autonomy
  - For the network: maintains quality of supply

#### **Electrical integration**

## Simplification of wiring and design

- Cornerstone: distributed power conversion
- Competing approaches: AC and DC

![](_page_7_Picture_4.jpeg)

- Accessible to any electrician
- Scalable: all conversion functions in micro-inverters
- Low efficiency
- High device cost

![](_page_7_Figure_9.jpeg)

#### **Electrical integration**

### **General architecture of DC microgrid**

![](_page_8_Figure_2.jpeg)

#### Gain in efficiency with DC: 5% to 8% vs. AC<sup>1</sup>

<sup>1</sup>D. Fregosi, S. Ravula, D. Brhlik, J. Saussele, S. Frank, E. Bonnema, J. Scheib, and E. Wilson, "A comparative study of DC and AC microgrids in commercial buildings across different climates and operating profiles," in *2015 IEEE First International Conference on DC Microgrids (ICDCM)*, 2015, pp. 159–164.

![](_page_8_Picture_5.jpeg)

#### Alignment between local consumption and production

Storage

•••

![](_page_9_Figure_2.jpeg)

- Storage can increase self-consumption fraction by ca. 20 pc
- Does not remove demand peaks

### Self-consumption by design

- Better static matching between generation and load: new criterion for system optimisation
- Daily profile: azimuth angles
- Annual profile: tilt angles e.g., roof vs. façade
- Technology choice
- Safest option for customer

![](_page_10_Figure_7.jpeg)

	PV generation % annual		Self-consumable
Technology	energy consumption		fraction
	Peak hours	Total	
Thin-film silicon	83%	63%	95%
Standard	216%	165%	36%
crystalline silicon			
High-performance	232%	177%	31%
crystalline silicon			

Match between generation and consumption for school building

![](_page_11_Picture_0.jpeg)

- Large BIPV potential to be tapped by making PV a natural component of the building envelope
- Products & design to solve some integration challenges
  - Visual: many technical options, difficult trade-offs
  - Structural: technical solutions demonstrated, require strong collaboration
  - Electrical: AC and DC options, storage, design for self-consumption; much left to do
- Business integration challenge to be solved on its own.
